

MANN MCGOWAN

Advanced Intumescent Technology

Superior quality intumescent technology

The Glass and Glazing Federation had a Fire Risk Assessment carried out in conjunction with the Regulatory Reform (Fire) Order. This assessment highlighted a few areas that required work to be undertaken.

Description

As active members of the GGF, we were asked to carry out fire-stopping works. Within the centre core of the building, service ducts carry cables and pipes through the three floors. These services puncture the floor slabs and therefore, the fire integrity needs to be maintained. A combination of products were used to carry out these works, including Fyrebag 240 intumescent bags, and Pyromas intumescent sealant. To minimise disruption, these works were carried out over a weekend.

Fyrebag 240 and Pyromas have been fire tested in accordance with BS476 Part 22 and can provide up to four hours fire resistance.

The GGF represent the UK Glazing industry with a number of highly specialist groups within the organisation. Mann McGowan Managing Director Kevin Hulin, is currently the Chairman of the Fire Resisting Glazing Group.

Project Name

FIRE STOPPING AYRES STREET

Client Name

GLASS AND GLAZING FEDERATION
